

- A persistent myth suggests that there's already a cure for cancer, but it's being concealed from the public. This notion is unfounded.
- **Billions** have been invested in cancer research over many decades, yet we haven't discovered a single cure.
- **Pharmaceutical companies** wouldn't find it profitable to hide a cure. Here's why:
  - **Complexity**: Cancer's diversity makes a single cure improbable.
  - **Economic Sense**: Even if a silver bullet existed, testing it across various cancer types and stages would take **decades** and require substantial funding.
  - **Transparency**: The sheer scale of research and manufacturing would make keeping a cure secret nearly impossible.
- **Survival Progress**: Cancer survival rates have **doubled** in the last 40 years due to ongoing research. [In the UK, half of those diagnosed with cancer in 2019 are expected to survive for 10 years or longer](#)
